

GRAVITY FEED CALIBRATION

The package begins with two placeable cell types and two fixed ports. The source and collection port belong to the contract, while falling and fixed cells belong to the operator.

APPROVED MATERIALS

ITEM	CONTROL	ROLE IN THIS CONTRACT
 FALLING CELL	PLACEABLE	Moves downward through open space during simulation and forms the delivered material stream.
 FIXED CELL	PLACEABLE	Remains stationary and redirects the falling stream by occupying grid space.
 SOURCE PORT	FIXED	Emits the contract input. Its location is supplied by the project save and cannot be moved.
 COLLECTION PORT	FIXED	Consumes cells that reach it and records the contract output trace.

Package boundary: modifier cells remain unavailable. The first contract is meant to establish routing with only motion, obstruction, and gravity.
